"Mankind's future"

The coming decades will be dramatic enough for humanity even without atomic wars or other military confrontations. Dangers such as overpopulation, destruction of the environment, a decreasing supply of raw materials, educational and intellectual deficiencies in a large part of the population, dangers such as these are gradually becoming apparent to the average European, American and Asian and are forcing the governments to exercise foresight, to be responsible and to deal with more problems than ever before.

Professor Hermann Oberth in his book "The Space Reflector" says that "In order to gain time against the greatest danger, namely overpopulation, it is urgent that we take in hand the following technological projects :

- With the aid of the space reflector we:
- Will increase the amount of arable land on earth.
- Will improve the climate.
- Will keep the Arctic harbors free of ice.
- Will provide the earth with a source of energy which is not harmful to the environment in which can also be used to produce electricity.
- Will provide energy which can be used as microwave beams to propel rockets into space, etc.
